How to install and remove software using the APT command

- formula `sudo` + `apt` + `install` + `package name`
- The **install** option install the specific package
- The **remove** option removes the specific option
- You can **install/remove** multiple programs by adding the package name with a space between each package.
- You can also **remove** package by adding an `-` sign at the end of the package name.package.
- You can **add and remove** packages at the same time by using a `+`
- and `-` at the end of each package.
- ## Here are some useful examples
- - Install several programs in a single command
- - `sudo apt install firefox flameshot caffeine -y`
- - Remove several programs in a single command
- - `sudo apt remove firefox flameshot caffeine -y`
- - Install and remove programs in a single command
- - `sudo apt install firefox+ flameshot- caffeine- vlc+`
- - Remove programs and all remaining traces
- - `sudo apt purge firefox+ flameshot- caffeine- vlc+`
-

How to create a shell script step by step including screenshots and how to run it. Try to be as detailed as possible.

1. ## Open the text editor

- On debian 13 go to application menu like GNOME and click on text editor

2. ## Create a new script file

- Create a folder in file manger home where the Bash will be save .for example home/cis106/notes/Notes4/notes4.sh
- Open Gnome text editor from you application menu
- Every shell script start with a Shebang `#!/bin/bash`
- Type #!/bin/bash and save in the folder scripts and give a name for example notes4.sh

Open

notes4.sh
~/cis106/notes/Notes4

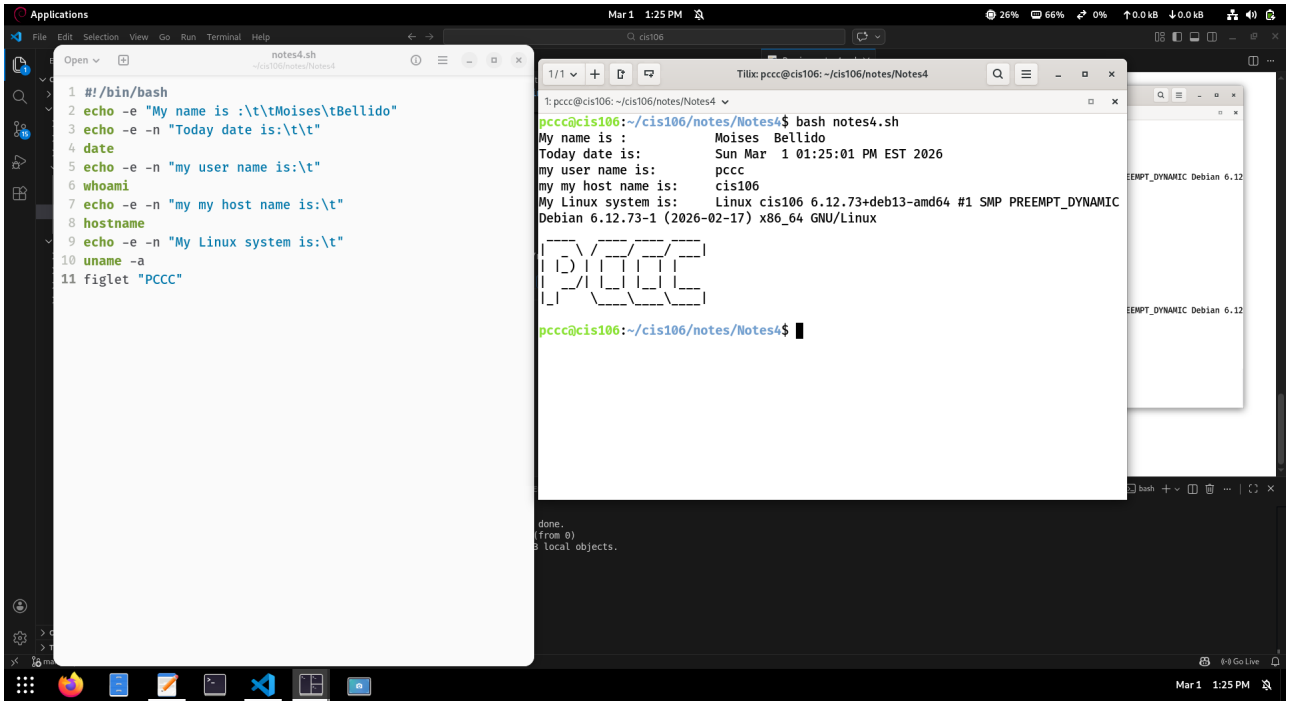
```bash
#!/bin/bash
echo -e "My name is :\t\tMoises\tBellido"
echo -e -n "Today date is:\t\t"
date
echo -e -n "my user name is:\t"
whoami
echo -e -n "my my host name is:\t"
hostname
echo -e -n "My Linux system is:\t"
uname -a
figlet "PCCC"
```

-

3. Write the code

- The first line is the shebang it tells the computer to use the Bash interpreter to run this file.
- Add some commands to the script.
- #!/bin/bash
- Echo -e " My name is:\t\tMoises\tBellido"
- Echo -e -n " today date is:\t\t"
- date
- echo -e -n "My user name is:\t"

- whoami
- echo -e -u "My hostname is:\t"
- hostname
- echo -e -n " My linux system is:\t"
- uname -a
- figlet 'PCCC"

4. Running the script


- save the script
- Open the a terminal(or go to home/cis106/notes/Notes4/) and right click in open tilix here.
- Run the bash : type the name of the Bash `bash notes4.sh` and enter.
-
